Program Curriculum

The Certificate Program requires 20 weeks to complete. It consists of 5 units, each of which is divided into 4 modules that last for one week. Each module includes a video lecture, interaction with the instructor and colleagues through discussion boards, and—where relevant—additional readings. Completion of the entire Program is required to receive continuing education credits. Information about continuing education credit specific to each discipline can be found [here](#). In addition to required readings and videotapes lectures, students participate in online discussions. All of these activities occur at the convenience of the participant.

Program Outline

Unit 1. Basic Concepts Module 1. The Integrated Care Perspective This module reviews the various ways that behavioral health can be integrated into primary care and the literature on efficacy and implementation. The perspective of population-based care, or the systematic management of health conditions in communities, is described. The population-based care approach is used to inform the basis of discussion for all models of integrated care. Integrated care models are contrasted with traditional mental health practice to provide concrete guidelines for successful integration. **Module 2. Basic Concepts in Integrated Care** The following topics are introduced:

- Collaborative care (care manager) models
- Population-based care approaches
- Introduction to outcomes measurement and registry management
- Consulting psychiatry models
- Telehealth

Module 3. Billing The module describes the use of CPT codes and translation of diagnoses from DSM-IV to ICD systems. Methods for analyzing the financial impact (cost/benefit analyses) of integrated care are introduced. **Module 4. Record Keeping** Best practices in recording patients contacts and storing patient records are reviewed. Common barriers to integrated billing and record-keeping are discussed, including state-by-state variations in regulations and setting-specific issues. **Unit 2. Provider Competencies and Characteristics Module 1. Functional/Strategic Patient Care** The methods and theoretical bases for patient care in brief interactions are reviewed. Emphasis is placed on the transition from a traditional mental-health perspective to that of a primary care provider. Topics include:

- The step-wise care model/functional diagnostic skill development
- Core components of a primary care behavioral health visit
- The language and pace of primary care
- Cultural, economic, and spiritual factors in treatment and health behavior change

Module 2. Communication with Primary Care Providers Best practices in communicating effectively with primary care providers and other staff are reviewed. Motivational interviewing is introduced as a tool for improving the effectiveness of mental and behavioral interventions throughout the clinic. Topics include:
